                                            A novel 7-transmembrane receptor (AAW12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a conva clone (AAT59619) isolated from a human T cell lymphoma tissue cDNA clone (AAT59619) isolated HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hyperchlosenia, hypoparathyroidism, hypertatment.

The present sequence is a human G-protein coupled receptor (GPCR) used for comparison with the seven transmembrane domain of a novel GPCR designated h15571. h15571 GPCR polymclectides and polypeptides may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GPCR expression. Such diseases includes immune, haematological, fibrotic, hepatic and respiratory diseases including asthma, allergies (e.g. allergic thinitis and psoriasis), pathogenic infections, chronic inflammatory diseases, organ-specific autoimmunity, graft rejection, graft versus host disease, cystic fibrosis and, in the production of antibodies against GPCR and in assays to identify modulators (agonists and antagonists) of GPCR expression and activity. The anti-GPCR antibodies may be used as diagnostic agents for detecting the presence of GPCR mithodies may be used as diagnostic agents for detecting the presence of GPCR may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an isolated or purified peptide (I) that is a parathyroid hormone type 2 (PTH2) receptor ligand (Ia) or PTH1 receptor ligand (Ib). (I) has anorectic, neuroleptic, antidepression, nootropic, analgesic, antimigraine, antidiabetic, osteopathic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tuberinfundibular peptide of 39 residues; TIP39; PTH2 receptor ligand;

activities, and is an PTH receptor antagonist. The peptide is useful in the treatment of a disorder mediated by binding a PTH2 tor PTH1 receptor. The PTH2 receptor binding activity may be used in treating obesity or other eating or metabolic disorders, mental disorders (e.g. depression, schizophrenia and dementia), acute or chronic pain, migraine or headaches, diabetes and other metabolic disorders, osteoporosis, hypercalcaemia and other disorders affecting calcium metabolism, hypertension, congestive heart failure and control of tumour growth, asthma, emphysema or other restrictive lung diseases, and demyellnating conditions such as multiple sclerosis and leukodystrophies. The present sequence represents a PTH2 receptor which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tuberinfundibular peptide of 39 residues; TIP39; PTH2 receptor ligand;
 cytostatic, antiasthmatic and neuroprotective

The present invention describes an isolated or purified peptide (I) that is a parathyroid hormone type 2 (PTH2) receptor ligand (ID) or PTH1 receptor ligand (ID). (I) has anorectic, neuroleptic, antidepression, nootropic, analgesic, antimigratine, antidabetic, osteopathic, hypertensive, cardiant, cytostatic, antiasthmatic and neuroprotective activities, and is an PTH receptor antiasthmatic and neuroprotective activities, and is an PTH receptor antiagonist. The peptide is useful in the treatment of a disorder mediated by binding a PTH2 or PTH1 receptor. The PTH2 receptor binding activity may be used in treating obesity or other eating or metabolic disorders, mental disorders (e.g. depression, schizophrenia and dementia), acute or chronic pain, migraine or hypercalcaema and other metabolic disorders, osteoporosis, hypercalcaema and other disorders affecting calcium metabolism, hypertension, congestive heart failure and control of tumour growth, asthma, emphysema or other restrictive lung diseases, and demyelinating conditions such as multiple sclerosis and leukodystrophies. The present sequence represents a PTH2 receptor which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4

```
(PTHIR) from the zebrafish. Its coding seequence was obtained by sequencing a cDNA clone. The gene and protein can be used to detect diseases in man where the receptor is either overexpressed or underexpressed, and they can be used to treat these diseases, which may be developmental, physiological or neurological disorders. They can also be used to identify agonists and antagonists which can be used in a similar manner. In addition, the gene can be used for chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zebrafish; parathyroid hormone type-1 receptor; PTH1R; developmental disorder; physiological disorder; neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acids encoding parathyroid hormone receptors PTHIR and PTHIR, useful for treating diseases or disorders associated with impaired receptor functions comprises a specific nucleotide sequence

This sequence is a parathyroid hormone receptor type I (PTHIR)
receptor protein of the invention. The invention also relates to a PTH3R
receptor protein. Anagonists of PTHIR or PTH3R can be used for the
treatment of diseases associated with an increase in PTHIR or PTH3R
activity, respectively. The peptides are used for diagnosis or prognosis
of diseases and disorders associated with PTHIR or PTHIR, such as cancer.
The polypeptides can be used as a molecular weight markers on sodium
dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) gels, or
on molecular sieve gel filtration columns. Antigenic epitope-bearing
peptides and polypeptides are useful to raise antibodies, including
monoclonal antibodies, that bind specifically to a polypeptide. The
peptides are useful during diagnosis of diseases and disorders in
mammals involving PTHIR or PTH3R receptor expression or function.
Mutations that affect PTHIR or PTH3R sequence and/or expression levels
of PTHIR or PTH3R could be diagnostic for patients with disease or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                           disorders of a developmental, physiological or neurological nature, nucleic acid molecules are valuable for chromosome identification. T mapping of DNAs to chromosomes is an important first step in correlating those sequences with genes associated with disease.
receptor 1 for treating disorders associated with receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6
                                                                                                                                                                                                                                                                                                                                              Parathyroid hormone/parathyroid hormone-related protein (PTH/PTHrP) receptors (AAR92275 and AAR92775) are encoded by CDNA clones OK-H (AAT15945) and OK-O (AAT15946), respectively, isolated from an opossum kidney (OK) cell cDNA library. OK-H and OK-O may be the products of 2 separate genes or of a laboratory artifact. The receptor induces an increase in intracellular cAMP and calcium when challenged with PTH or PTHrP. Recombinant receptors can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hyporaclacemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor can be used for diagnostic measurement of PTH serum levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         260

The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.

```

The parathyroid hormone/parathyroid hormone related protein (PTH/PTHFP)

receptor protein sequence was deduced form the DNA sequence of the
clone OK-0, isolated from opossum kidney (OK) cells. The clone OK-0
is identical to the OK-H clone exept at the C-terminal tail as OK-0
is identical to the OK-H clone exept at the C-terminal tail as OK-0
clonedes a 585 amino acid protein, OK-H encodes one of 515 amino acids.
The difference is attributed to a single nucleotide deleted in the OK-H
companies of the companies of the opening opening opening of the opening opening opening of the opening openi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4
                                                                                                                                                                                                                                                                                                                                                  Parathyroid hormone/parathyroid hormone-related protein (PTH/PTHrP) receptors (AAR92375 and AAR92776) are encoded by CDNA clones OK-H (AAT15945) and OK-O (AAT15946), respectively, isolated from an opossum kidney (OK) cell cDNA library. OK-H and OK-O may be the products of 2 separate genes or of a laboratory artifact. The receptor induces an increase in intracellular cAMP and calcium when challenged with PTH or PTHrP. Recombinant receptors can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocaloaemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor can be used for diagnostic measurement of PTH serum levels.

The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      84 lypqaeesrevsdrsrlqdgfclpewdnivcwpagypgkvvavpcpdyfydfnhkgrayr 143

The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTH.P and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTH.P for binding can be identified using the protein prod. and DNAs homologous to PTH DNA can be identified using fragments of the clone as probes. The protein may be used for the prodn. of antibodies useful for the treatment,

The present sequence is a human G-protein coupled receptor (GPCR) used for comparison with the seven transmembrane domain of a novel GPCR of comparison with the seven transmembrane domain of a novel GPCR designated h15571. h15571 GPCR polymorleotides and polypeptides may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GPCR expression. Such diseases includes immune, haematological, fibrotic, hepatic and respiratory diseases including asthma, allergies (e.g. allergic rhinitis and psoriasis), pathogenic infections, chronic inflammatory diseases, organ-specific autoimmunity, graff rejection, graff versus host disease, organ-specific autoimmunity, particular, liver fibrosis. The GPCR polypeptides may be used as antigens in the production of antibodies and antagonists) of GPCR expression and activity. The anti-GPCR antibodies and decreating the presence of GPCR antibodies may be used as diagnostic agents for detecting the presence of GPCR may be

          A rat parathyroid hormone/parathyroid hormone-related protein (PTH/PTHP) receptor (AAR92277) is encoded by CDNA clone RISB (AAT15947) isolated from a rat osteosarcoma ROS 17/2.8 CDNA library. The receptor a G-protein linked receptor having 7 transmembrane domains. It induces an increase in increase in increase in can produced in vector and oalcium upon challenge with PTH or PTHPP. Recombinant receptor can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor are used for diagnostic measurement of PTH

                                                                                                                                                                                                                                                                                                                                                                                           for
                                                                                                                                                                                                                                                                                                                                      This sequence represents the rat parathyroid hormone (PTH) receptor R15B, which is targeted by the antibody of the invention. The antibody of the invention is immunoreactive with naturally occurring human, rat opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and the diagnosis of PTH-related hypercalcaemia.

Control of parathyroid hormone-2 receptor messenger ribonucleic action of parathyroid hormone-2 receptor messenger ribonucleic action of parathyroid hormone. The action of parathyroid specific Receptor For Parathyroid Hormone. The Activity of THIS RECEPTOR IS MEDIATED BY G PROPEINS WHICH ACTIVATE ADDRIVITY CYCLASE. PTHRZ MAY BE RESPONSIBLE FOR PTH EFFECTS IN A NUMBER OF PHYSIOLOGICAL SYSTEMS. IT MAY PLAY A SIGNIFICANT ROLE IN PANCREATIC FUNCTION AS A NEUROPARANSMITTER RECEPTOR.

TISSUE SPECIFICITY: ABUNDANILY EXPRESSED IN BRAIN, ARTERIAL AND CARDIAC ENDOTHELIUM. FOUND AS WELL IN SPERM. IN THE HEAD OF THE EPIDIAMIS. LOWER EXPRESSION IS POUND IN VASCULAR SMOOTH MUSCLE, EXCERNE PANCREAS, TESTIS AND PLACENTA.

EXTINITARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the European Bioinformatics Institute. "A G protein-linked receptor for parathyroid hormone-related peptide.";
lormone-related peptide.";
science 254:1024-1026(1991).
-I-FUNCTION: THIS IS A RECEPTOR FOR PARATHYROID HORMONE AND FOR PRATHYROID HORMONE-RELATED PEPTIDE. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE DEDIVING.
CYCLASE AND ALSO A PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER
